REAL ESTATE PERFORMANCE ANALYTICS

OPTIMIZING SALES EFFICIENCY
AND CUSTOMER EXPERIENCE (2023 - 2025)

MAHMOUD HAMDY

THE BUSINESS PROBLEM

The real estate sector in 2025 faces challenges in maintaining the growth rate achieved in 2024.

The main problem lies in the fluctuation of conversion rates in some major cities such as Miami during the first quarter, in addition to a performance gap between top agents and the rest of the team. This analysis aims to explore the causes of this fluctuation and provide a data-driven strategy to improve sales efficiency and customer experience.

DESCRIPTION OF THE DATA, ITS SOURCE, AND THE TECHNICAL WORK PLAN

DATA SOURCE

An Excel file consisting of 5 sheets (Sales, Visits, Customers, Agents, Properties) with more than 5,000 local records. This structure has been carefully cleaned and modeled to ensure accurate, highly detailed reports and reliable trend analysis across the 2023-2025 period.

TECHNICAL CORE

Data Transformation: Cleaning and structuring a large database distributed across 5 main tables (more than 5000 records per table).

Data Modeling: Designing an advanced data model based on the Star Schema to accurately link sales and visits with customers and agents.

Advanced DAX: Building smart measures and advanced formulas to calculate conversion rates and perform time intelligence analysis.

User Experience (UI/UX Design): Designing an interactive intelligent user interface that provides an overall view and supports quick decision-making.

Annual Sales Trend

2025

THE GAP EXPLANATION

01

At the beginning of 2024: the year started strong (15 million in January), then there was natural fluctuation, but the overall trend was rising to reach 22 million in April.

This indicates an "active market" and quick customer response.

At the beginning of 2025: the situation is different; January started at 13 million (less than the previous year), then the decline and stagnation continued (9 million in February and March) reaching only 4 million in May.

2. Strategic explanation of the gap (The Gap Explanation) This variance confirms that the problem is not only in "Miami," but in the "overall market behavior" at the beginning of 2025: Low Lead Conversion: in 2024, visitors converted into deals quickly.

In 2025, despite visits, there is a "waiting stance" from buyers, resulting in weak referrals and therefore lower achieved sales.

Delayed seasonality: May 2025 sales (4 million) compared to May 2024 (77 million on the big dashboard) indicate that the market in 2025 is experiencing a "delay" in the start of the peak season.

AGENT PERFORMANCE ANALYSIS

02

Based on analytical reports, 15 agents top the 'Highest Conversion' list in terms of their sales performance

AGENT PERFORMANCE ANALYSIS

02

Qualitative Efficiency Standard:

Evaluation does not rely solely on the number of units, but on "price persuasion power"; as the ability to sell villas at high prices reflects exceptional negotiation skills.

Performance Gap:

The report showed a divergence in levels; where the efficiency of some agents drops to 17%, necessitating a training plan to transfer the expertise of "elite agents" to the rest of the team.

AGENT PERFORMANCE ANALYSIS

02

The data revealed that customers who joined in 2024 represent a golden opportunity for "retargeting" operations. By analyzing their purchasing behavior and purchasing power, customized offers can be designed to increase their lifetime value.

ACTIONABLE RECOMMENDATIONS

Experience Transfer Strategy:

Organize workshops led by the top 15 agents to transfer "persuasion tactics" to the rest of the team, with a focus on how to market luxury units (Villas).

Seasonal Marketing:

Intensify advertising campaigns in Miami before the start of the summer peak to ensure early customer acquisition.

Inventory Improvement:

Direct company investments to provide additional "apartment" units in New York and Miami due to the high turnover in this sector.

THANK YOU
